HOW TO DO WELL IN MATH

Go from “I’ll be happy if I pass” to “I’m DOMINATING this math class!”

You may have heard (or have your own) horror stories about how hard math is!
But don’t stress! ASP is here to help with these simple formulas!
(Get it? Formulas! Math joke! See, you’re enjoying it already!)

1. Understand First, *Then* Practice

Yes, in this order. Before you throw yourself into solving math problems, make sure you thoroughly understand the concepts. If you don’t, you’re basically trying to run before you can walk.

2. Start Strong

As you may know, you can’t do super-well on a test by letting things go, then cramming it up the night before. This is *ESPECIALLY* true when it comes to math. You can avoid that mess by just by doing these 2 things!

- Doing the homework
- Asking questions in class when anything is unclear – don’t wait!

Why do these 2 simple things help so much??

Because math builds on itself, so missing even *one* concept can cause you to feel lost by the end of the lecture. So any time you don’t understand, ask ASAP.

BONUS!!! The professor will notice your participation – and your classmates will secretly thank you for asking what they want to know too!

BOTTOM LINE:

You CAN do well in math. This approach can give you a new experience if you let it! And remember: your professor, your classmates, and free tutoring services can help too.
