Default Question Block

Comparing Perceptions of Academic Engineering Educators and Classroom Technology Teachers Round 1 research study survey - Items clustered into five categories.

INTRODUCTORY NOTE TO OUR EXPERT PANELISTS

Dear Colleagues,

Your assistance with this study is gratefully appreciated. The study has been designed to compare perceptions of post-secondary academic engineering educators and high school engineering and technology teachers relative to the concepts both groups feel high school graduates students should learn. This Delphi study will be conducted in three rounds. The timetable is shown below:

June 7 - Survey round one is conducted. Participants are asked to respond within two weeks.

June 21 - Survey round one responses are due. Analysis of round one responses begins.

July 19 - Survey round two is conducted with items modified as a result of panel suggestions. Participants are asked to respond within two weeks.

August 2 - Survey round two responses are due. Analysis of round two responses begins.

August 30 - Survey round three is conducted with items modified as a result of panel and BGU suggestions. Participants are asked to respond within

September 16 - Survey round three responses are due. Analysis of round three responses begins.

Before starting the actual survey, we are asking you to complete a section that provides demographic information. Your name and affiliation will remain anonymous until the end of the study, at which time you will be asked if you would like your name included when results are disseminated. The demographic section will be much shorter in the two subsequent rounds since most information is needed only once.

A section entitled "Survey Explanation and Guidance" appears just below the demographic section.

Thank you sincerely,

Michael Hacker, Researcher, (Hofstra University) Moshe Barak, Ph.D., Research Supervisor, Ben Gurion University, Beersheva, Israel)

SURVEY EXPLANATION AND GUIDANCE

This survey is intended to determine which competencies related to engineering and technology are most important for all students in the United States to attain by the time they graduate from high school.

These competencies are not intended to be of specific value only for students who would pursue careers in engineering or technology; rather, they are competencies all students should assimilate as part of their fundamental education.

For each of the following survey items please indicate how important you believe the competency is for all high school graduates in the United States to attain. You would rate an item to be important if you believed that it reflects key knowledge or skill, fundamental principles, organizing concepts, significant ideas, major standards or benchmarks, generalizable ideas, or common themes. You would rate an item not to be important if you believed it to be trivial, too complicated for most high school students, or necessitating too many resources (e.g., instructional time, teacher knowledge, facilities, etc.).

You are asked to rate each item on a seven-point scale where (7) indicates that you strongly agree that the item is important and (1) indicates that you strongly disagree that the item is important. After you respond to each item you have an opportunity to suggest re-wording of the item, suggest deletions, and suggest other competencies that should be added.

Competencies have been clustered into five content categories in engineering and technology education that prior research has shown to be overarching: **design**, **modeling**, **systems**, **resources**, and **human values**. As this study limits student competencies to these five categories, please be kind enough to restrict new item suggestions to concepts or skills that you believe fall within them.

If you do wish to suggest a new item related to any of the five content categories, please state that item in behavioral terms (for example students will "model," "design," "evaluate," "create," etc.) as opposed to saying that students will "understand." Additionally, as this research is focused on identifying the most salient and transferrable ideas in engineering and technology education, please ensure that any items suggested for addition are not too technically specific or too atomistic in nature.

DESIGN:

To demonstrate knowledge of important engineering and technology concepts and skills, upon graduation from high school students will be able to demonstrate engineering design capability as follows:
