

# MiSP Cyclic Phenomena Worksheet #2 L1

Name \_\_\_\_\_

Date \_\_\_\_\_

## Tides and the Moon

### Introduction:

It is not surprising that people who live on Long Island are familiar with tides. After all, they live on an island. They have all been to beaches and docks and noticed that the water is constantly changing in height. Water moves away from the shore and the water level decreases. Hours later, the water has moved back and the water level is higher. In this activity we will look at data for the changing tides and water levels at Montauk.

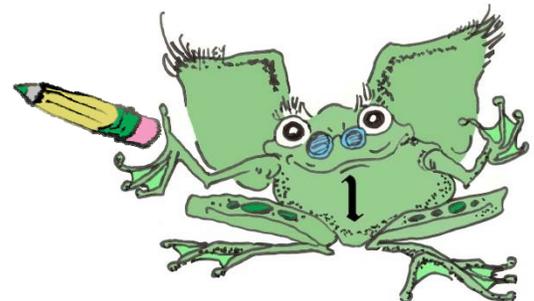

### Procedures:

- Look at the data on the chart, “Montauk Water Levels on January 1 and 2, 2010.” Note that it lists the water level every hour (using a 24-hour clock) from 0.00 (midnight) on January 1 (New Year’s Day) to 23:00 (11:00 p.m.) on January 2.

### Graph your data:

Graph the data on the next page to show the relationship between the time (hours) and the water level (feet).

- Label the  $x$ -axis with time (hours). Use the column of continuous hours from 0 to 47. Also label hour 24, which is midnight on January 2, with “Jan 2” to show when the second day begins. Each line on the  $x$ -axis will represent 2 hours.
- Label the  $y$ -axis with water level (feet).
- Connect the data points.
- Give your graph a title.

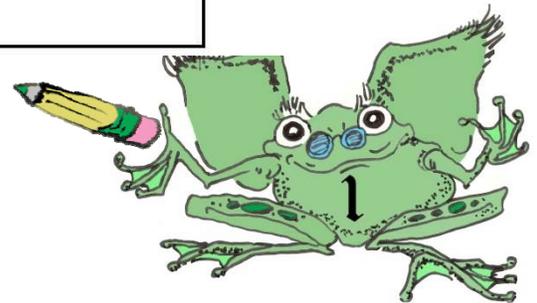

Empty rectangular box at the top of the page.

Vertical empty rectangular box on the left side of the page.

Large grid area for drawing or writing, consisting of 20 columns and 30 rows of small squares.

Horizontal empty rectangular box at the bottom of the grid area.

### Discussion Questions:

1. Why is the Montauk water level (tide) data an example of a cycle?

---

---

2. At what hours did high tide (highest water levels) and low tide (lowest water levels) occur?

Times of high tide: \_\_\_\_\_

Times of low tide: \_\_\_\_\_

3. How many high tides and how many low tides were there per day on January 1 and 2?

Date	Number of High Tides	Number of Low Tides
January 1		
January 2		

4. How many hours apart are

Each HIGH tide from the next LOW tide? \_\_\_\_\_

Each HIGH tide from the next HIGH tide? \_\_\_\_\_

Each LOW tide from the next LOW tide? \_\_\_\_\_

5. Using the graph, predict when (what hour) the next high tide and the next low tide will be on January 3. January 3 begins at hour 48, which is 00:00 or 12:00 midnight.

First HIGH tide on January 3 \_\_\_\_\_

First LOW tide on January 3 \_\_\_\_\_

6. Look at the high tides (the peaks) and the low tides (the valleys). Are the peaks the same (the same water level in feet)? \_\_\_\_\_

7. Are the valleys the same (the same water level in feet)? \_\_\_\_\_
